

Scrapyard animation

Here is a video of my first project using 3D printed parts and the pocket money kits. This is for my grandson's layout hence the mock up.

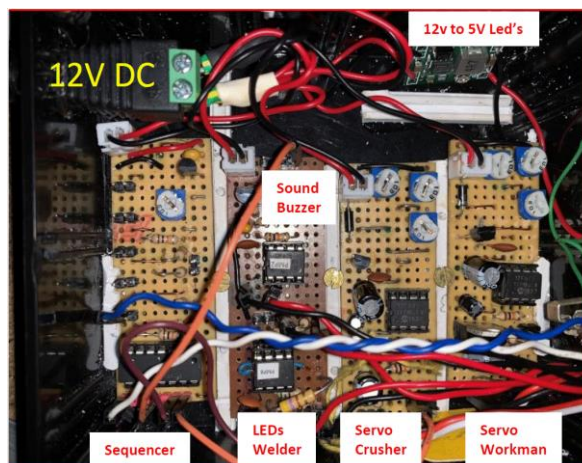

Servos are used to open the shed door, move the workman and rotate the crusher's crane.

The welder kit and the steam emulator kit are also fitted.

A sequencer kit controls the operations.

I modified the kits so the 12V power-in used a polarised JST connector for easy replacement if something goes wrong.

The sound and flashing LED kits were also combined on to one strip as well.
